Conventional Roll-to-Roll

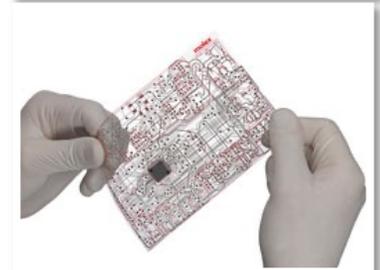

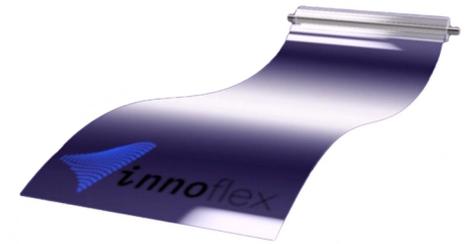

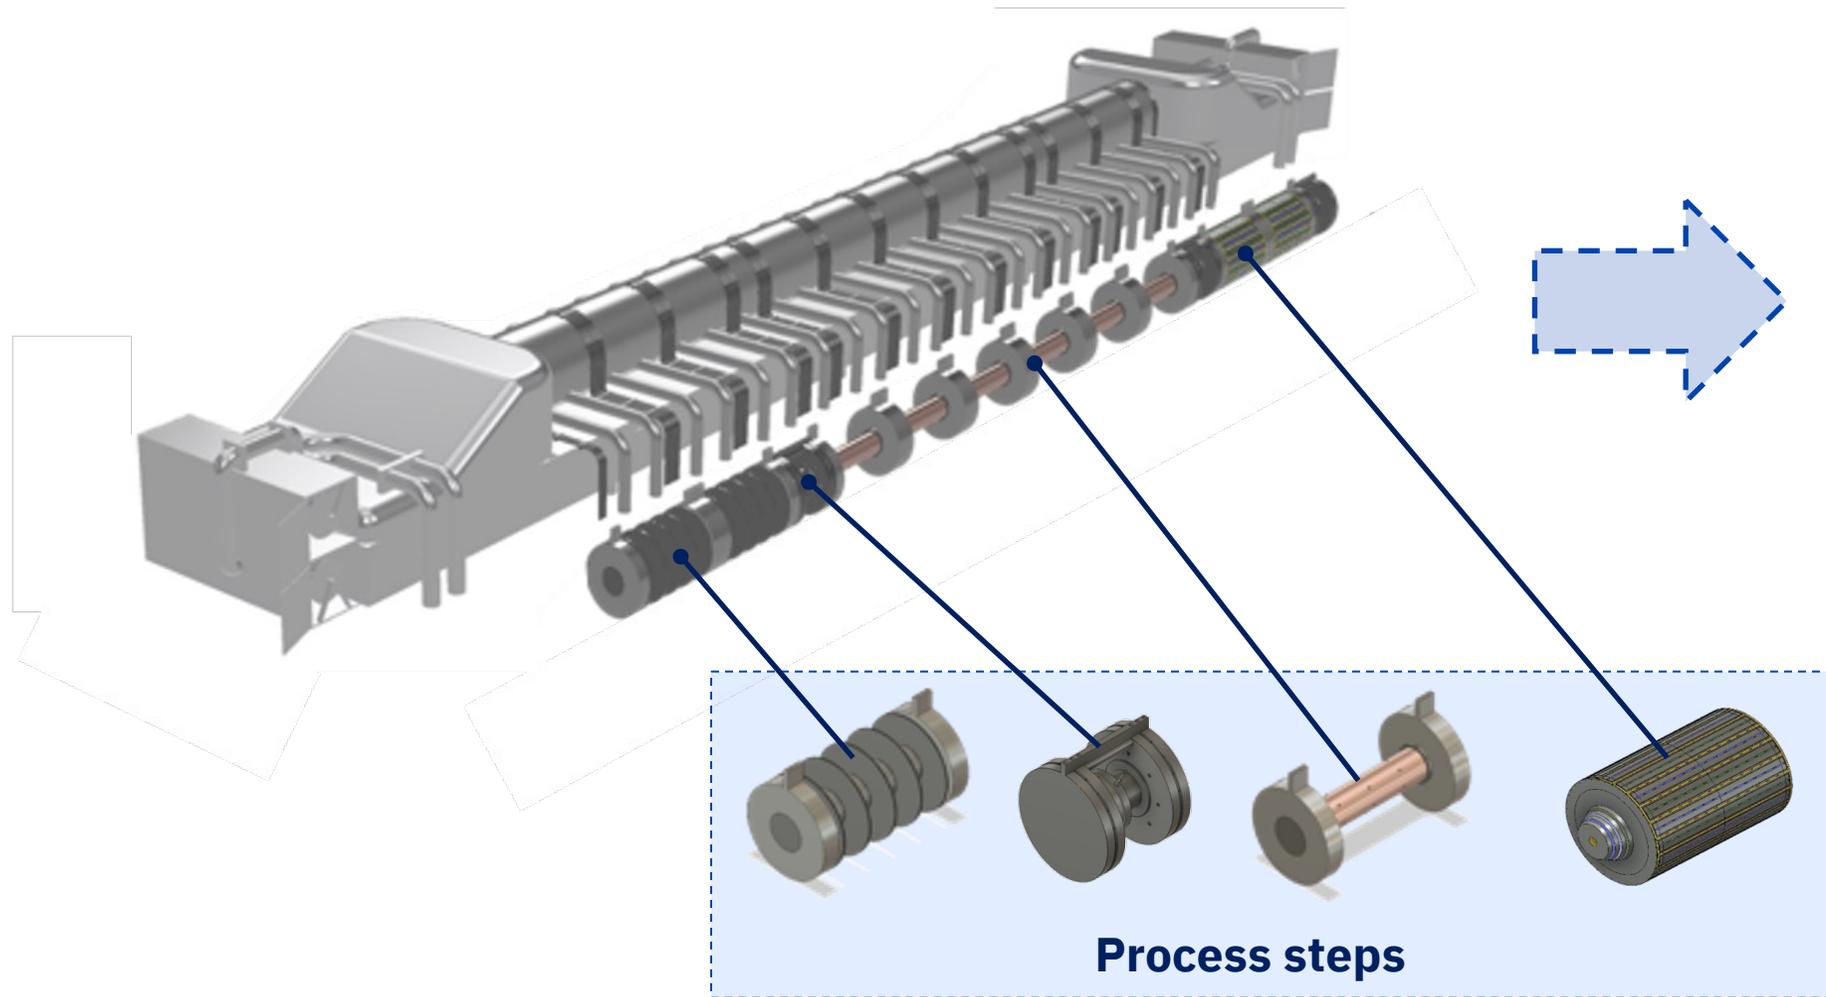

InnoFlex Roll-To-Roll concept

Design iterations

InnoFlex integration platform

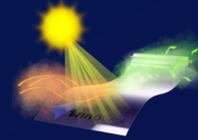

*Creating a healthy world
through nanotechnology*

PolluFix Aero

A foil that degrades air pollution

Each square meter cleans
7.000.000 m³/year*

Self cleaning

Heat reflective layer**

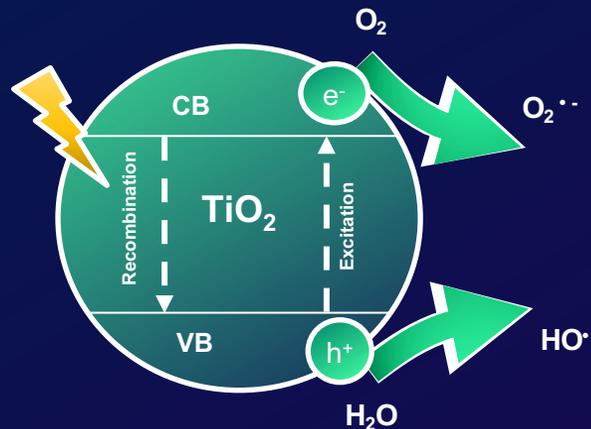

* The foil has an ultra-thin TiO₂ layer, which acts as a photocatalyst and neutralizes pollutants from the air. TiO₂ effectivity has been proven through an ISO test with great results.

** Additional layers like a heat reflective layer, optical layer or scratch resistant layer can be added.

Photocatalytic process

A process that degrades pollution by light energy

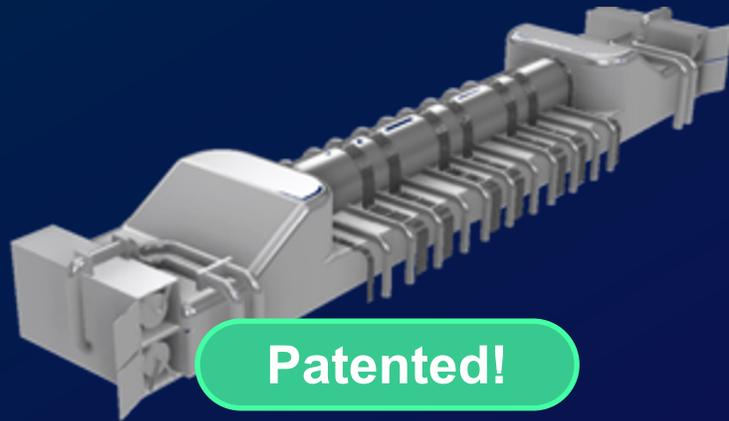

Process that uses semiconductor materials which are similar to materials found in solar cells.

Advanced production processes are required to make efficient photocatalytic products

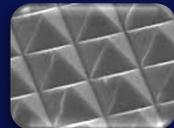

The trick...

For the first time semiconductor technology can be leveraged for very large scale surfaces

Patented!

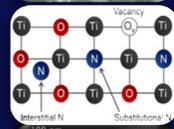

Mass produce and engineer a superior low-cost product

3D surface

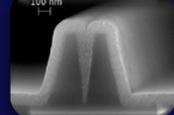

Higher contact per m²

A doped surface

Effective in shadow and indoors

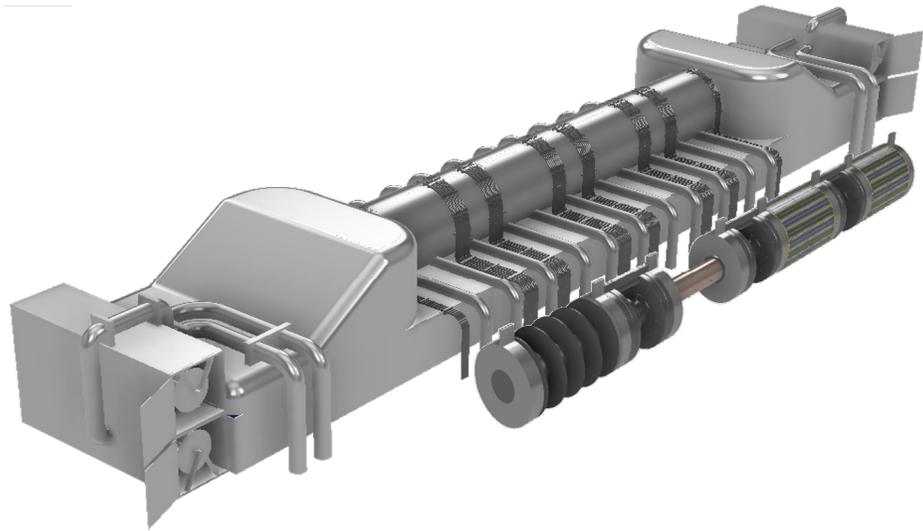

High quality layer

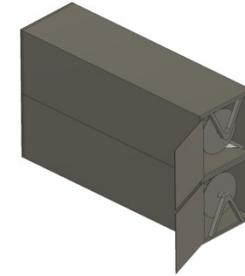

100% use of effective surface

Cross sectional equilibrium

Cross sectional equilibrium

Web tension profile

Max elongation:

$$\varepsilon = \frac{\Delta L}{L} = \frac{14}{2006} = 0,0071$$

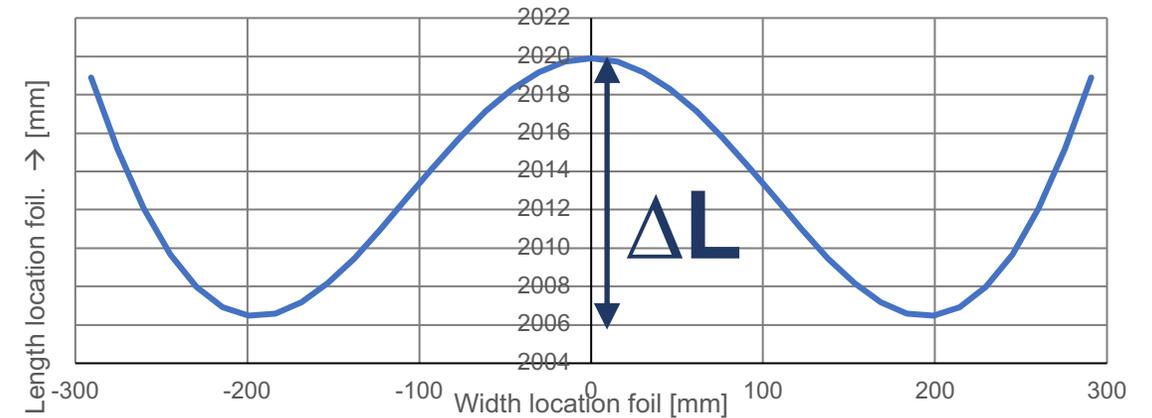

Belt & Substrate requirement:

at 0,085% elongation $\sigma < \sigma_v$

Using $\sigma = E * \varepsilon$ gives:

PTFE:	$\sigma_{PTFE} = 0,4$	$* 10^3 * 0,0071 = 2,8 \text{ MPa}$
Polyethylene	$\sigma_{PE} = 0,8$	$* 10^3 * 0,0071 = 5,6 \text{ MPa}$
PET	$\sigma_{PET} = 2,3$	$* 10^3 * 0,0071 = 16,3 \text{ MPa}$
Glass:	$\sigma_{Glass} = 80$	$* 10^3 * 0,0071 = 568 \text{ MPa}$
Aluminum	$\sigma_{AL} = 70$	$* 10^3 * 0,0071 = 497 \text{ MPa}$
SST	$\sigma_{SST} = 200$	$* 10^3 * 0,0071 = 1420 \text{ MPa}$

Flat to circular ΔL

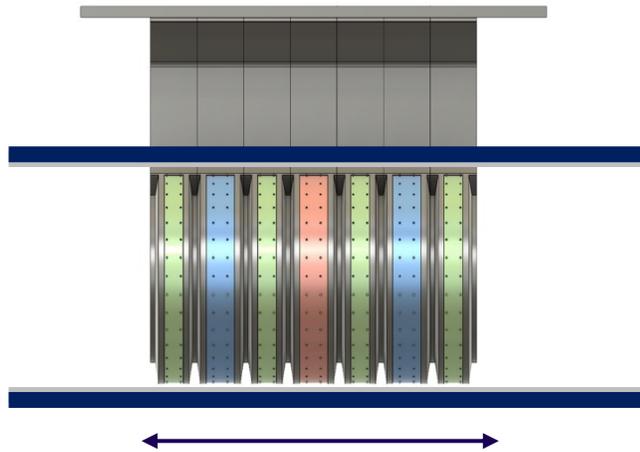

Mechanical mockup

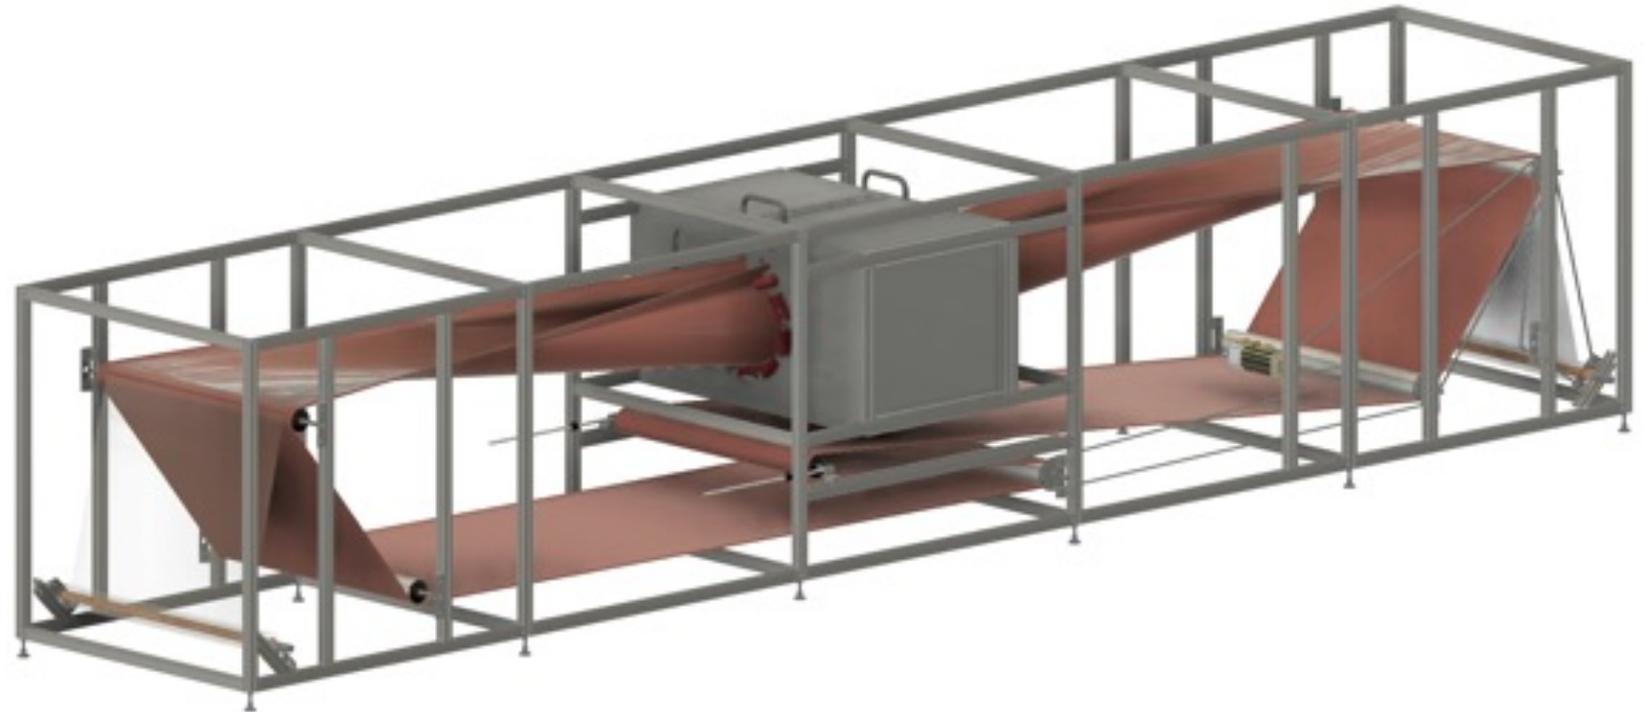

End 2022 - Demonstrator

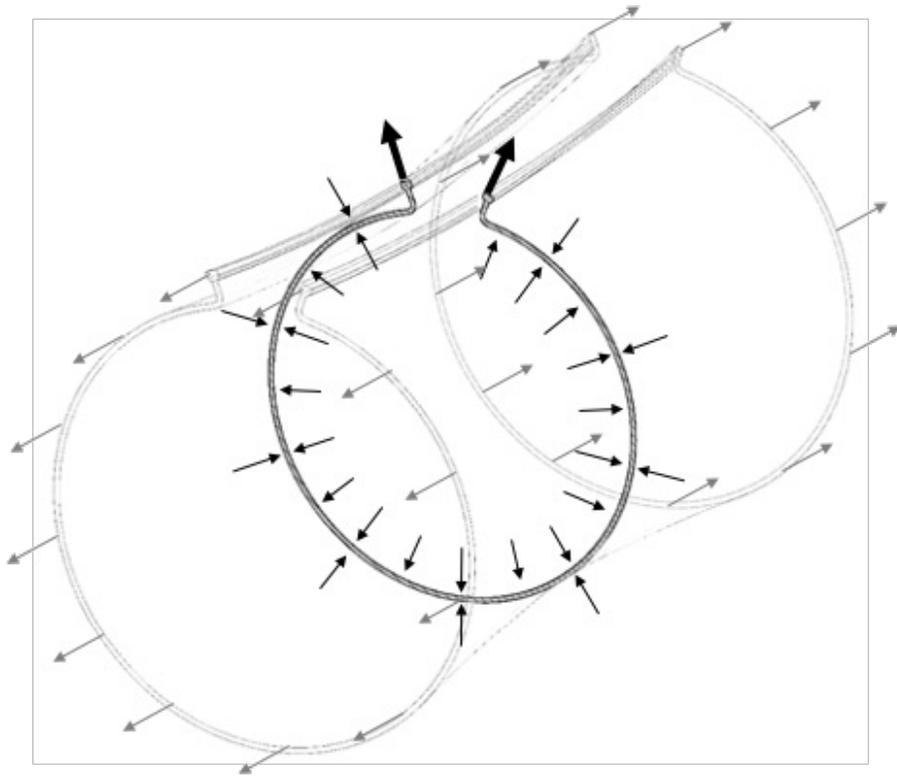

Stationary S-ALD head

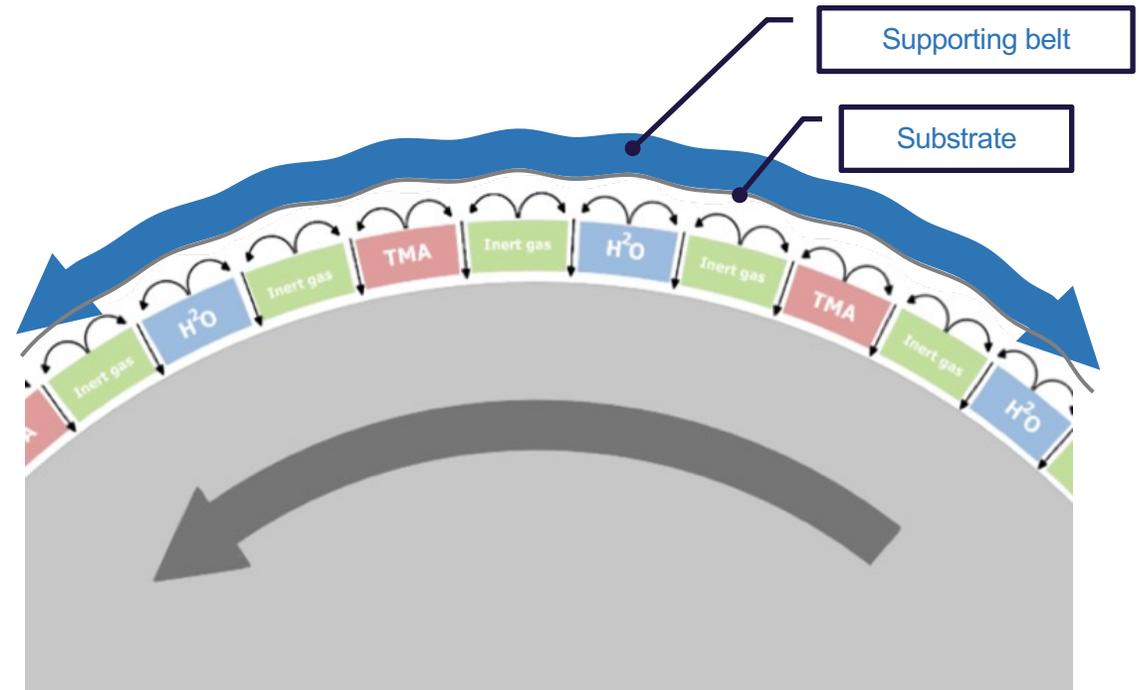

60 cm wide foils

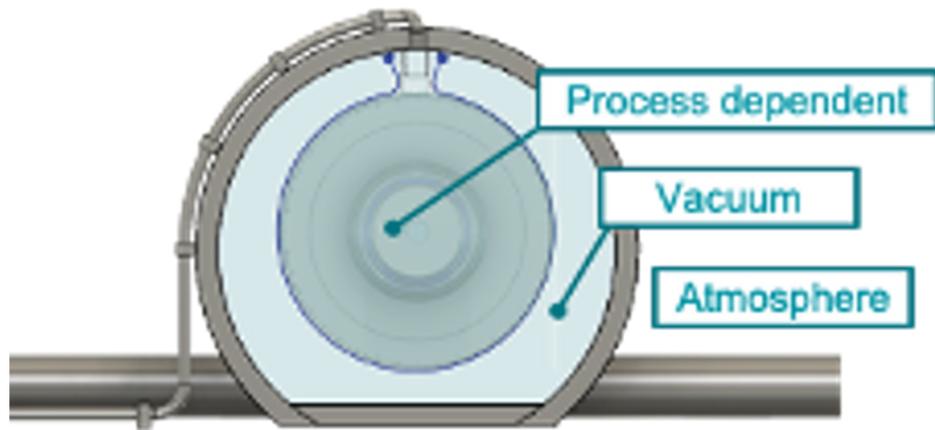

**Apply tension
both directions**

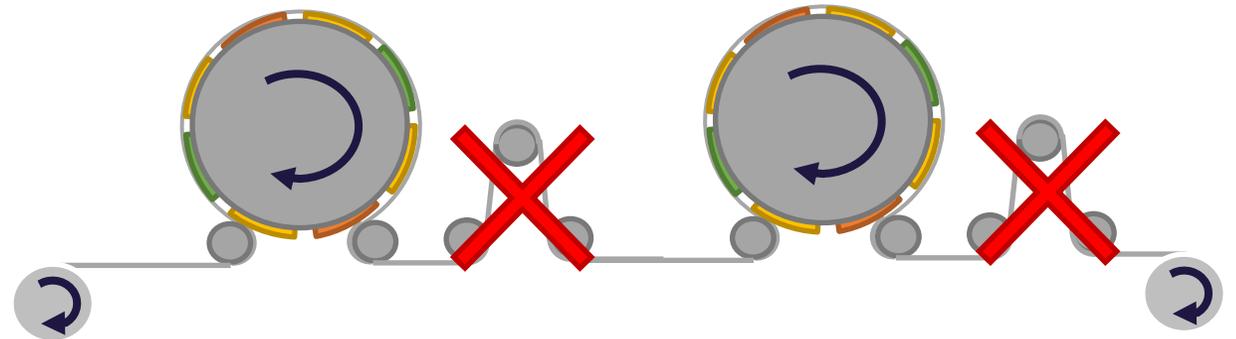

**Smaller air gap
deviation**

Separation of process environment

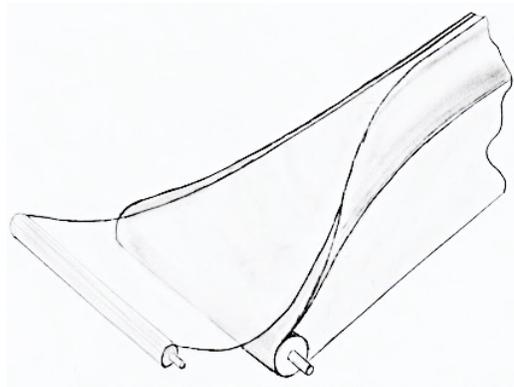

No handling

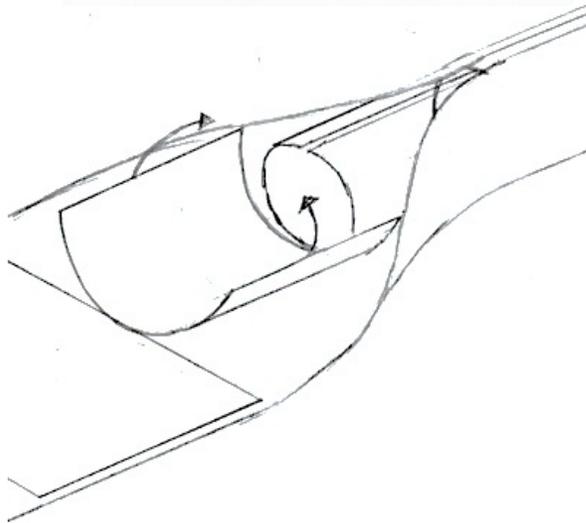

Other substrates

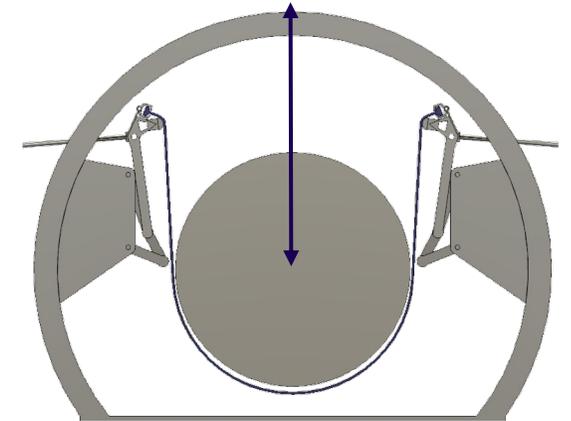

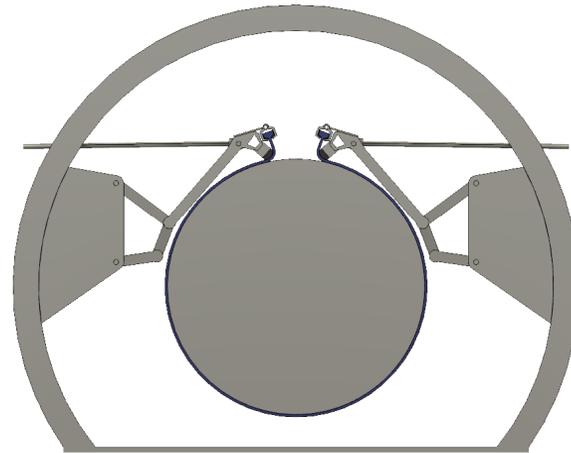

Roll-to-Roll

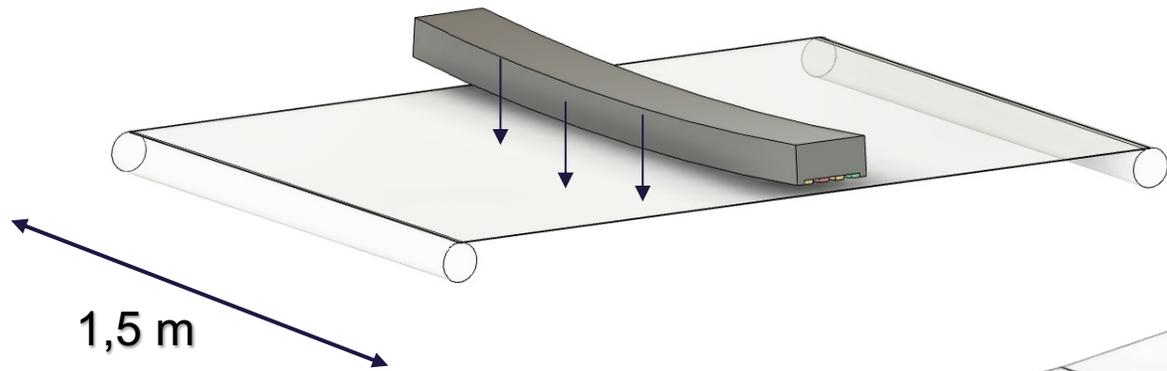

Sheet-to-sheet

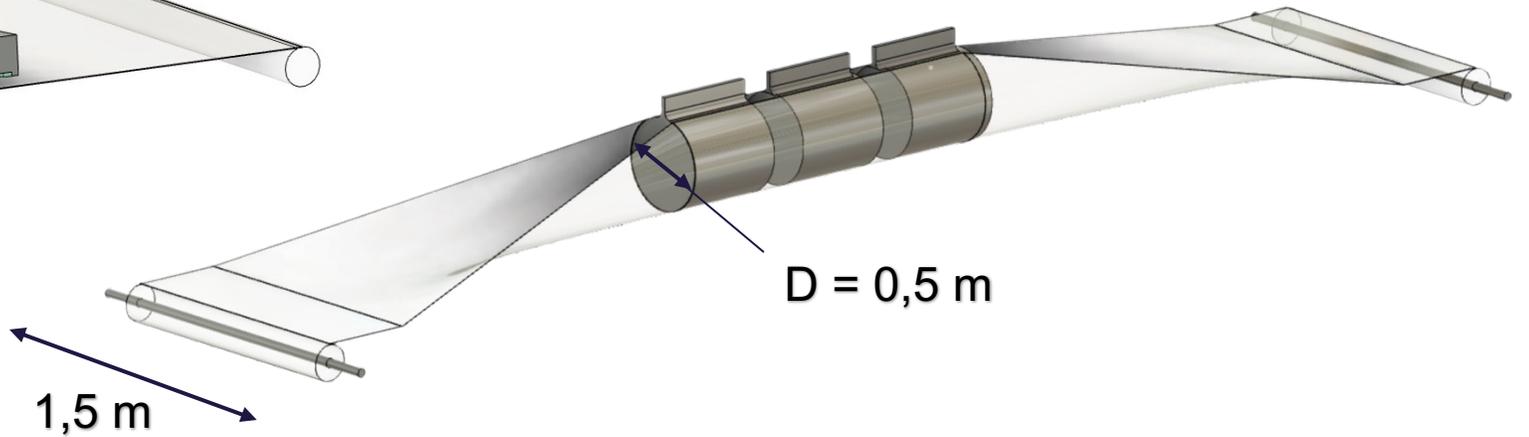

Fast replacing of deposition units

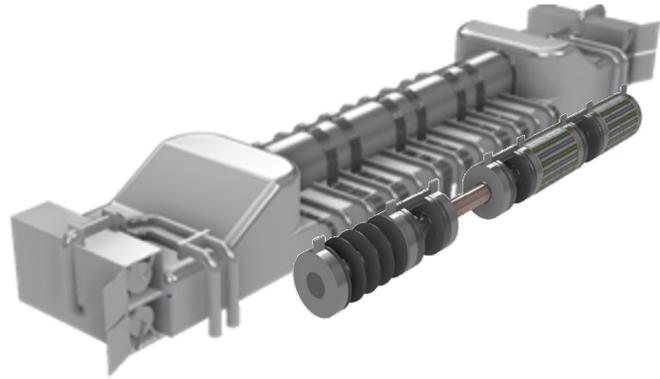

**No displacement
due to gravity**

**Smaller deposition
unit for foil size**

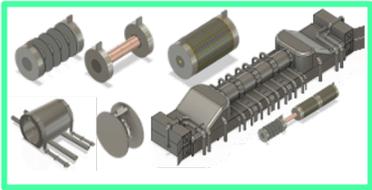

InnoFlex System overview

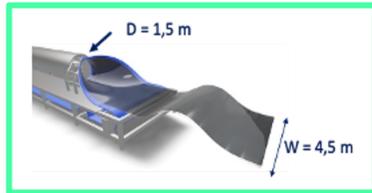

More features

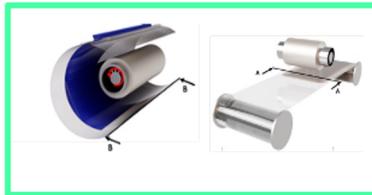

Modular

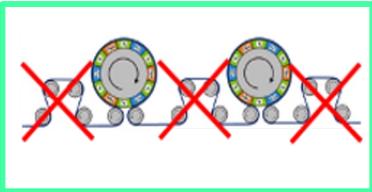

Large substrate sizes

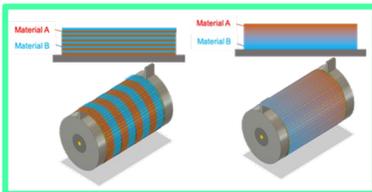

Better Layer uniformity

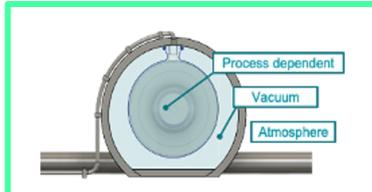

No handling

Transition layers, nanolaminates

No cleanroom

Lower cost

~ 40% Lower equipment cost

- No cleanroom
- Fewer high precision parts
- No handling equipment

~ 25 % Lower processing cost

- Less nitrogen use
- Higher yield

Etc.
